

Cylindrical antivibration mount type A (M-M)

Principal Characteristics

Cylindrical antivibration mounts type A (M-M) are anti-vibration mounts designed to minimise vibration and noise effectively. Manufactured with a cylindrical natural rubber body and galvanised steel armature with male-male fixing, they ensure simple and robust mounting. Perfect for applications on industrial machinery, pumps and motors, they offer strength and flexibility. Available in different hardnesses, they adapt to various requirements, ensuring reliable performance in a compact and durable design.

Cylindrical vibration dampers with male-male connections are mainly used to reduce vibrations and oscillations in mechanical systems, such as piping, cable lines, industrial equipment and structures subject to dynamic loads. These devices are damping elements that absorb the energy of oscillations, preventing them from propagating through the system.

The 'male-to-male' connection (threaded or pivot ends on both sides) facilitates installation, allowing the suppressor to be integrated into the system without the need for additional adapters or complex fixings. This makes them particularly popular in situations requiring quick installation or component replacement.
